Problem Description

In many restaurants, food orders are still handled manually, which can lead to delays, order errors, and a poor customer experience. Customers often need to wait in line or call the restaurant to place their orders, which can be inconvenient.

This project aims to develop an electronic food ordering system for restaurants, allowing users to browse the menu, select items, and place orders online. The system will help reduce waiting times, minimize errors, and improve the overall efficiency of the ordering process for both customers and restaurant staff.

Target Users

- Customers: who want to browse the menu, place orders, and track their order status
- Admin: who manages menu items and handles customer orders

Main Features

- User registration and login system
- Menu browsing with categories
- Add items to cart
- Order tracking (view order status)
- Admin dashboard to manage menu items
- Admin ability to update order status

System Architecture Overview

The system follows a Client-Server Architecture:

- The Frontend (Client) is responsible for displaying the user interface and handling user interactions
- The Backend (Server) handles business logic, authentication, and order processing
- The Database stores users, menu items, and order data

Technology Stack (Frontend / Backend / Database)

1. **Frontend:** React.js
2. **Backend:** Node.js
3. **Database:** MySQL

Expected Challenges

- Managing cart state and order calculations correctly
- Handling user authentication and roles (customer vs admin)
- Designing a clean and user-friendly interface
- Managing order status updates properly
- Ensuring smooth communication between frontend and backend APIs
